# CONTENTS

## INVITED PAPERS

<i>Čedomir Radović, Marija Gogić, Dragan Radojković, Vladimir Živković, Nenad Parunović, Aleksandar Stanojković, Radomir Savić</i> AGRO BIODIVERSITY AND LIVESTOCK FARMING: AUTOCHTHONOUS SPECIES AND BREEDS IN SERBIA (Serbia).....	1-12
<i>Vesna Gantner, Irena Jug</i> THE FUTURE OF AGRICULTURE PRODUCTION – COULD THE FORECASTED EVENTS BE ALTERED? (Croatia).....	13-22
<i>Slavča Hristov, Dušica Ostojić Andrić, Branislav Stanković</i> GENERAL PRINCIPLES AND GOOD ANIMAL WELFARE PRACTICES ON DAIRY CATTLE FARMS (Serbia).....	23-38
<i>Dušica Ostojić Andrić, Slavča Hristov, Radica Đedović, Teodora Popova, Vlada Pantelić, Dragan Nikšić, Nenad Mičić</i> EMOTIONAL STATE OF DAIRY COWS IN LOOSE AND TIED HOUSING SYSTEM - IS THERE A DIFFERENCE? (Serbia- Bulgaria).....	39-47
<i>Pero Mijić, Tina Bobić, Mirjana Baban, Maja Gregić, Franjo Poljak, Vesna Gantner</i> EFFECT OF STARTING MILK FLOW ON UDDER HEALT OF HOLSTEIN COWS (Croatia).....	48-54
<i>Dragan Nikšić, Vlada Pantelić, Dušica Ostojić Andrić, Predrag Perišić, Nenad Mičić, Marina Lazarević, Maja Petričević</i> FREQUENCY OF $\kappa$ -CASEIN AND $\beta$ -LACTOGLOBULIN GENOTYPES IN DAUGHTERS OF FIVE SIMMENTAL BULL SIREs (Serbia).....	55-63
<i>Marina I. Selionova, Magomet M. Aybazov, Milan P. Petrovic, Galina T. Bobryshova, Violeta Caro Petrovic</i> SCIENTIFIC DIRECTIONS OF SHEEP BREEDING DEVELOPMENT IN RUSSIA (Russia-Serbia).....	64-73
<i>Yessenbay E. Islamov, Gulzhan A. Kulmanova</i> CONDITION AND PROSPECTS OF SHEEP BREEDING DEVELOPMENT IN KAZAKHSTAN (Kazakhstan).....	74-85

<p><i>Violeta Caro Petrović, Milan P. Petrović Marina I. Selionova, Dragana Ružić-Muslić, Nevena Maksimović, Bogdan Cekić, Ivan Pavlović</i> SOME NON-GENETIC FACTORS AFFECTING LAMBS BIRTH WEIGHT IN F1 GENERATION OF MIS X ILE DE FRANCE (Serbia).....</p>	86-93
<p><i>Marjeta Čandek-Potokar, Nina Batorek Lukač, Urška Tomažin, Rosa Nieto</i> GROWTH RATE OF LOCAL PIG BREEDS: STUDY OF PROJECT TREASURE (Slovenia-Spain).....</p>	94-104
<p><i>Dubravko Škorput, Zoran Luković</i> SELECTION OPPORTUNITIES AND MAINTAINING GENETIC DIVERSITY IN LOCAL PIG BREEDS (Croatia).....</p>	105-114
<p><i>Juan M. García Casco, Juan L. Duarte, Carmen Caraballo, Miguel A. Fernández, Patricia Palma, María Muñoz</i> A GENETIC EVALUATION PROGRAM FOR MEAT QUALITY TRAITS IN IBERIAN BOARS FROM DIFFERENT LIVESTOCK ORIGINS (Spain).....</p>	115-122
<p><i>Patricia Palma Granados, Isabel Seiquer, Luis Lara, Ana Haro, Rosa Nieto</i> PROTEIN AND LIPID METABOLISM AND THEIR INTERACTION IN FATTY (IBERIAN) PIGS (Spain).....</p>	123-136
<p><i>Giacomo Biagi, Monica Grandi, Carlo Pinna, Carla Giuditta Vecchiato</i> HOW NUTRITION MAY INFLUENCE CANINE BEHAVIOR AND COGNITIVE ABILITIES (Italy).....</p>	137-147
<p><i>Aleksandar Stanojković, Čedomir Radović, Aleksandra Stanojković- Sebić, Marija Gogić, Violeta Mandić, Jakov Nišavić, Maja Petričević</i> ANTIMICROBIAL SUSCEPTIBILITY TESTING OF <i>STREPTOCOCCUS SUIIS</i> ISOLATES TO COMMON ANTIBIOTICS USED IN PIG FARMS (Serbia).....</p>	148-156
<p><i>Władysław Migdał, Bartosz Klusek, Łukasz Migdał, Anna Migdał, Maria Walczycka, Ewelina Węsierska, Marzena Zajac, Joanna Tkaczewska, Piotr Kulawik</i> THE CHEMICAL COMPOSITION AND QUALITY OF MEAT POLISH NATIVE CATTLE BREEDS (Poland).....</p>	157-166

<i>Yalçın Bozkurt, Tuncay Aydoğan, Cevedet Gokhan Tuzun, Cihan Dogan</i> A COMPUTERISED SYSTEM FOR PREDICTION OF SLAUGHTERING CHARACTERISTICS OF BEEF CATTLE (Turkey).....	167-176
<i>Maja Petričević, Dušan Živković, Dušica Ostojić Andrić, Dragan Nikšić, Veselin Petričević, Marija Gogić, Violeta Mandić</i> THE EFFECT OF THE FLAX SEEDS NUTRITION OF CATTLE ON PRODUCTION AND SLAUGHTER PROPERTIES (Serbia)....	177-185
<i>Giuseppe Bee, Antonia Katharina Ruckli</i> MORINGA OLEIFERA, AN ALTERNATIVE PROTEIN SOURCE TO SOYA IN PIG PRODUCTION? (Switzerland- Austria).....	186-190
<i>Miloš Lukić, Zdenka Škrbić, Veselin Petričević, Vesna Krnjaja, Zorica Bijelić, Nikola Delić</i> LAYING HENS MANAGEMENT AND NUTRITION FOR MAXIMAL EGG PRODUCTION AT 100 WEEKS OF AGE (Serbia).....	191-202
<i>Tanja Petrović, Snežana Stevanović, Dragana Paunović, Jasmina Rajić, Viktor Nedović</i> INNOVATION IN MEAT PACKAGING (Serbia).....	203-218
<i>Zorica Bijelić, Violeta Mandić, Vesna Krnjaja, Dragana Ružić-Muslić, Aleksandar Simić, Zdenka Škrbić, Dušica Ostojić Andrić</i> NITROGEN STATUS EVALUATION OF GRASS-LEGUME SWARDS UNDER FOUR N FERTILIZATION LEVELS (Serbia)	219-229
<i>Violeta Mandić, Zorica Bijelić, Vesna Krnjaja, Maja Petričević, Aleksandar Stanojković, Marija Gogić, Aleksandar Simić</i> SALINITY STRESS EFFECT ON SEED GERMINATION AND SEEDLING GROWTH OF SOME CROP PLANTS (Serbia).....	230-240

## **ORALLY PRESENTED PAPERS**

<i>Martin Wähner</i> PERSPECTIVES IN PIG FARMING IN GERMANY (Germany)..	241-249
--	---------

- Jovan Bojkovski, Jasna Prodanov-Radulović, Milica Živkov-Baloš, Radiša Prodanović, Sreten Nedić, Sveta Arsić, Ivan Vujanac, Ivan Doborsavljević, Suzana Đedović, Renata Relić, Dušica Ostojić Andrić*  
 BODY SCORE CONDITION OF SOWS AND THE THIN SOW SYNDROME AS HEALTH PROBLEMS ON COMMERCIAL FARMS (Serbia)..... 250-258
- Miguel Moreno-Millán, Delia Saleno, Gabriel Anaya, Yamila Pirovano, Florencia Azcona, Olivia Marcuzzi, Antonio Molina, Sebastián Demyda-Peyrás*  
 A COMBINATION OF KARIOTYPING AND MOLECULAR METHODS COULD INCREASE THE DETECTION ACCURACY OF CHROMOSOMAL ABNORMALITIES IN HORSES: A CASE REPORT IN PURA RAZA ESPAÑOL HORSE (Spain-Argentina) 259-266
- Maha I. Hamed, Taha A. A. El-Allawy, Esraa A. Hassnein*  
 EPIDEMIOLOGICAL AND THERAPEUTICAL STUDIES ON STRONGYLE INFECTION OF DONKEYS IN EGYPT.. 267-284
- Ivan Pavlović, Snežana Ivanović, Milan P. Petrović, Violeta Caro Petrović, Dragan Ružić-Muslić, Nevena Maksimović, Bogdan Cekić*  
 SEASON DISTRIBUTION OF GASTROINTESTINAL HELMINTHS OF GOATS KEPT UNDER SEMI-INTENSIVE CONDITIONS IN NORTH WEST SERBIA (Serbia)..... 285-292
- Antonov Valeryi Alekseevich, Grishina Marina Anatolievna, Nikolaev Sergei Ivanovich, Itskovich Aleksandr Yurievich*  
 INCLUSION SPORE PROBIOTICS «ENSIMSPORIN» IN RATIONS OF SWINES AND ITS EFFECTS ON PRODUCTIVITY, NON-SPECIFIC AND SPECIAL RESISTANCE OF PREGNANT AND LACTATING SOWS (Russia) ..... 293-304
- Łukasz Migdał, Krzysztof Krzysztoforski, Anna Migdał, Władysław Migdał*  
 THE INFLUENCE OF AGE AND BREED OF PIGS ON THE CONTENT OF TOTAL AND SOLUBLE INTRAMUSCULAR COLLAGEN (Poland)..... 305-315
- Ivan Yanchev, Kamelia Kancheva*  
 POSIBILITIES FOR UTILIZATION OF CARBON DIOXIDE FROM POULTRY IN GREENHOUSE PLANTED LETTUCE (*LACTUCA SATIVA*) (Bulgaria)..... 316-325

## POSTER SECTION I

*Marinela Enculescu*

EVALUATION OF THE HAEMATOLOGICAL PROFILE AND  
SERUM ENZYMES DURING THE TRANSITION PERIOD IN  
DAIRY COWS (Romania)..... 326-335

*Muamer Pekmez, Admir Dokso, Muhamed Brka*

EXTERNAL CHARACTERISTICS OF HOLSTEIN-FRIESIAN  
BREED ON AREA OF FEDERATION OF BOSNIA AND  
HERZEGOVINA (Bosnia and Herzegovina)..... 336-341

*Miloš Marinković, Predrag Perišić, Dušica Ostojić Andrić, Vlada*

*Pantelić, Nikola Molerović, Nenad Mičić, Vladimir Živković*  
THE EFFECT OF SIRES ON THE SEMEN QUALITY OF  
HOLSTEIN-FRIESIAN BULLS (Serbia)..... 342-351

*Ivan Ćosić, Dragana Ružić Muslić, Nevena Maksimović, Bogdan*

*Cekić, Dragan Nikšić, Nenad Mičić, Miloš Marinković*  
THE EFFECT OF PARTICULAR PARAGENETIC FACTORS ON  
FERTILITY AND MILK PERFORMANCE PROPERTIES OF  
COWS (Serbia)..... 352-362

*Nenad Mičić, Miloš Marinković, Vlada Pantelić, Dragan Nikšić,*

*Marina Lazarević, Nikola Molerović, Ivan Ćosić*  
PRODUCTION PERFORMANCES AND HERD BOOK OF  
SIMMENTAL AND HOLSTEIN FRIESIAN CATTLE IN  
CENTRAL SERBIA (Serbia)..... 363-372

*Madlena Andreeva, Nikola Metodiev, Bogdan Cekić, Rossen*

*Stefanov*  
STUDY OF THE EFFECTS OF LOW TEMPERATURES ON THE  
MORPHOLOGICAL STATUS OF RAM SPERMATOZOA  
(Bulgaria-Serbia)..... 373-381

*Tsonka Odjakova, Pavel Todorov, Atanaska Zgurova*

MONITORING AND TRENDS FOR DEVELOPMENT OF  
SREDNORHODOPSKA SHEEP (Bulgaria)..... 382-392

<i>Rossen Stefanov, Georgi Anev, Madlena Andreeva, Plamen Todorov, Nevena Maksimovic</i> DIFFERENT OESTRUS SYNCHRONIZATION PROTOCOLS IN LACTING NORTH-EAST BULGARIAN MERINO SHEEP IN ANESTRAL PERIOD (Bulgaria-Serbia).....	393-400
<i>Daniela Miteva, Stayka Laleva, Teodora Angelova, Daniela Yordanova, Nikolay Ivanov</i> QUALITY MILK COMPOSITION AND COAGULATION ABILITY IN SHEEP FROM THE BULGARIAN DAIRY SYNTHETIC POPULATION WITH DIFFERENT GENOTYPES (Bulgaria).....	401-410
<i>Jaroslava Bělková, Miroslav Rozkot, Eva Václavková</i> THE PIG PRODUCTION IN THE CZECH REPUBLIC - REQUIREMENTS FOR FARROWING MANAGEMENT IN HIGHLY PROLIFERATIVE SOWS (Czech Republic).....	411-422
<i>Oleksandr Tsereniuk, Oleksandr Akimov, Yuriy Chereuta, Mikola Kosov</i> FEATURES OF SPERM INJECTION INTO GENITAL TRACTS OF SOWS AND GILTS IN ARTIFICIAL INSEMINATION (Ukraine).....	423-430
<i>Nenad Stojiljković, Dragan Radojković, Čedomir Radović, Marija Gogić, Vladimir Živković, Radomir Savić, Aleksandar Stanojković</i> THE VARIABILITY OF ECONOMICALLY IMPORTANT TRAITS MONITORED IN THE PERFORMANCE TEST OF GILTS UNDER THE INFLUENCE OF FARM, YEAR AND SIRE BREED (Serbia).....	431-441
<i>Elena Cibotaru, Grigore Darie, Alisa Pirlog, Doina Plesca</i> THE ROLE OF ANTIOXIDANTS IN BOAR SEMEN PRESERVATION (Moldova).....	442-448
<i>Ksenija Nešić, Marija Pavlović, Vladimir Radosavljević</i> INSECTS – A NEW BRANCH OF ANIMAL HUSBANDRY? (Serbia).....	449-458
<i>Mirna Gavran, Dragan Dokić, Maja Gregić, Vesna Gantner</i> THE ASSOCIATION OF ROE DEER POPULATION WITH WEATHER CONDITIONS IN HUNTING AREA IN EASTERN CROATIA IN PERIOD 2008-2018 (Croatia).....	459-467

*Rositsa Shumkova, Ralitsa Balkanska*  
INFLUENCE OF MICROBIOLOGICAL PRODUCT BAIKAL  
EM1 ON THE DEVELOPMENT OF HYPOPHARYNGEAL  
GLANDS ON WORKER BEES AND THORACIC GLANDS ON  
WORKER BEES AND BEE DRONES (Bulgaria)..... 468-478

*Dragan Dokić, Maja Gregić, Mirna Gavran, Vesna Gantner*  
SIGNIFICANCE OF INVESTMENTS IN AGRICULTURAL  
PRODUCTION ON THE EXAMPLE OF THE RURAL  
COUNTIES OF THE REPUBLIC OF CROATIA (Croatia)..... 479-487

## POSTER SECTION II

*Radojica Djoković, Zoran Ilić, Marko Cincović Vladimir Kurćubić,  
Miloš Petrović, Milan P. Petrović, Violeta Caro Petrović*  
INSULIN RESISTANCE IN DAIRY COWS (Serbia)..... 488-504

*Goran Vučković, Mirna Gavran, Maja Gregić, Pero Mijić, Ranko  
Gantner, Marcela Šperanda, Vesna Gantner*  
THE INFLUENCE OF MASTITIS RISK ON RESPONSE TO  
HEAT STRESS IN DAIRY SIMMENTAL COWS (Croatia)..... 505-515

*Mahmoud R. Abd Ellah, Ghada I. Soliman, Mohamed A.H. Abd  
Elhakeim, Hanan K. Elsayed*  
EFFECT OF NATURAL *STRONGYLUS* SPP. INFECTIONS ON  
SYNOVIAL FLUID CONSTITUENTS IN DONKEYS (Egypt)... 516-525

*Jasna M. Kureljušić, Aleksandra Tasić, Jadranka Žutić, Branislav  
Kureljušić, Ljiljana Spalević, Suzana Vidaković, Dragana  
Ljubojević*  
SURVIVAL OF SALMONELLA IN PIG CARCASSES IN  
SLAUGHTERHOUSES (Serbia)..... 526-532

*Jadranka Žutić, Olivera Valčić, Branislav Kureljušić, Dobrila  
Jakić-Dimić, Jasna Kureljušić, Nemanja Jezdimirović, Nemanja  
Zdravković*  
SEROPREVALENCE TO *MYCOPLASMA HYOPNEUMONIAE* IN  
GILTS AND SOWS (Serbia)..... 533-540

*Dragana B. Ljubojević Pelić, Suzana Vidaković, Sandra Jakšić,  
Miloš Pelić, Jelena Vranešević, Jasna Kureljušić, Brankica  
Kartalović, Milica Živkov Baloš*  
THE OCCURRENCE OF RESIDUE OF ANTIBIOTICS AND  
SULPHONAMIDES IN DIFFERENT TYPES OF HONEY (Serbia) 541-547

<i>Ivan Mičić, Zoran Rajić, Marija Mičić</i> ECONOMICS OF SUSTAINABLE AGRICULTURAL PRODUCTION AND ANALYSIS MACROINVERTEBRATES OF WATER SOURCES IN SERBIA (Bosnia and Herzegovina- Serbia).....	548-557
--	---------

### POSTER SECTION III

<i>Bojan Stojanović, Goran Grubić, Nenad Đorđević, Aleksa Božičković, Aleksandar Simić, Vesna Davidović, Aleksandra Ivetić</i> EFFICIENCY OF PROTEIN UTILIZATION BY GRAZING RUMINANTS AND POSSIBILITY FOR IMPROVEMENT (Serbia).....	558-568
<i>Dragana Ružić-Muslić, Milan P. Petrović, Zorica Bijelić, Violeta Caro Petrović, Nevena Maksimović, Bogdan Cekić, Ivan Ćosić</i> ALTERNATIVE SOURCES OF PROTEIN IN LAMB DIET (Serbia).....	569-579
<i>Vesna Krnjaja, Slavica Stanković, Ana Obradović, Tanja Petrović, Violeta Mandić, Zorica Bijelić, Marko Jauković</i> THE EFFECT OF CLIMATE CONDITIONS ON AFLATOXIN CONTAMINATION OF CEREAL GRAINS AND FEEDS (Serbia)	580-591
<i>Marija Pavlović, Aleksandra Tasić, Ksenija Nešić, Snežana Ivanović</i> SACCHAROMYCES CEREVISIAE IN FEED FOR RUMINANTS (Serbia).....	592-600

**Abstract:** Forage grass-legume mixture are highly productive ambience of different plant species intended for animal nutrition. The competitiveness of species in the mixtures is one of the important traits that significantly affect grassland management. The goal of the study was to evaluate nitrogen nutrition index of pure lucerne and their mixtures with grasses and sainfoin subjected to four different levels of nitrogen in three years duration. The experiment had a randomised block design with four replicates and eight treatments. Examined treatments were pure lucerne crop and mixtures of lucerne, orchard grass, tall fescue and sainfoin in the same proportion and four nitrogen fertilization rates (0, 70, 140, 210 kg ha<sup>-1</sup>). Pure lucerne achieved higher yield by 12.8% than their mixtures. Forage production was the highest at 210 kgN ha<sup>-1</sup> which was 14.6% more than treatments without nitrogen. Nitrogen uptake by the plant that were fertilized with N was significantly higher than the plants that were not fertilized. In all three experimental years control nitrogen treatment had satisfactory value of nitrogen nutrition index while other N treatments showed luxury consumption. Soil N reserves and nitrogen fixation in the treatment where N was not applied, were sufficient to ensure enough biomass production.

**Key words:** biomass production, grass-legume mixtures, nitrogen consumption

### Introduction

In addition to water, nitrogen is one of the major limiting factors in production of forage biomass in the natural ecosystems. After mineralization of organic matter in the soil, N becomes available to plants in the form of nitrate and ammonium ions. The amount of available nitrogen in the soil varies from year to

year, depending on a number of factors such as: climate, mineralization intensity and amount of organic matter. How much nitrogen will be used from the soil depends on plant species and of its yield potential. Different species in the grass-legumes mixtures have different capabilities for nitrogen accumulation and production of biomass, therefore, N assimilation in grass-leguminous mixtures strongly depends on the selection of species for mixtures. Plant requirements for nutrients are not constant during vegetative growth. After defoliation in the early stages of regrowth, larger quantities of N for the development of leaf mass and photosynthesis are required (*Marino et al., 2004*). Further, the structural composition of plant tissues is dominated by components with low nitrogen contents such as cell walls, which means that the N requirements per unit of dry matter decrease (*Lemaire and Salette, 1984*).

Nitrogen originating from the soil and mostly deriving from mineralization is often not enough for plants to achieve potential yield. Grass-leguminous mixtures also provide N from symbiotic nitrogen fixation where the legumes fix the atmospheric N<sub>2</sub> and create for themselves as well as associated species, conditions with larger N supply. In that way, legumes and grasses meet their own N-demand deriving from symbiosis more than 80% or 40% of N, respectively (*Nyfelner et al., 2011*). The remaining part of the missing nitrogen is recovered from soil nitrogen and N from mineral fertilizers. If the amount of added nitrogen is not fully utilized for yield production, it leads to an increased risk of nitrogen leaching into deeper soil layers, which is a major problem for the environment (*Tripolskaja and Verbyliene, 2014, Marin et al., 2017*). In order to avoid these losses, the French have developed a mathematical model for diagnosis of N status during the vegetative cycle of plants that could be further used for N fertilization planning. This model is based on a critical concentration of nitrogen (N<sub>c</sub>) in plants, i.e. a minimum amount of N necessary to achieve maximum yield (*Lemaire and Gastal, 2009*). According to *Lemaire and Gastal (1997)* the equation for calculating N<sub>c</sub> for perennial grasses and legumes is:

$$N_c = 4.8DM^{-0.32}$$

The content of nitrogen in plants during vegetation is not constant and it changes depending on the vegetative growth of the plant. *Lemaire et al. (1985)* showed that for grasses and lucerne the decline in plant N concentration (%N) is related to dry matter accumulation (DM) whatever the climatic or the species and genotype. Also, *Farruggia et al. (2004)* have concluded that values of N<sub>c</sub> at the start of the growing period are high and decline during growth, in relation to dry matter accumulation.

Nitrogen nutrition index (NNI) is defined as the ratio between the actual concentration of nitrogen in the plants and  $N_c$  (Lemaire and Meynard, 1997):

$$NNI = \frac{N_m}{N_c}$$

According to Duru *et al.* (1997), when NNI is close or equal to 1 (0.8-1), the N plant status is considered satisfactory. A deviation from this range, when the NNI is below 0.8, means that there is insufficient supply of N, or when NNI is above 1 there is an oversupply of N: a value of 0.6 indicating that crop N availability was only 60% of the critical level (Louarn *et al.*, 2015).

Today, due to increasing pollution of natural resources, water, air and soil, scientists place the environment protection as the priority, which undoubtedly limits agricultural production. Also, taking into account climate change and increased energy consumption for the production of mineral fertilizers, agriculture carries the global burden of humanity, whether to increase production in order to feed the growing human population or reduce the impact on the environment and warming of the atmosphere. For these reasons, the monitoring of the dynamics of nitrogen adoption during the vegetative cycle of plants and the assessment of the nutrition status is of great importance.

The aim of this study is to evaluate the nitrogen nutrition index of different grass-legume mixtures fertilized with four different levels of nitrogen and to predict their nutritional status through mathematical model.

## Materials and Methods

The study was carried out on the experimental field of Institute for Animal Husbandry, Zemun, Belgrade (44°49'N, 20°17'E, and elevation 96 masl), during three year period. At the experimental site, the mean annual precipitation was 714.4 mm and mean annual temperature 16.7°C. The soil is a low carbonate chernozem with pH of 7.26 and well supplied with humus and nitrogen. Agrochemical characteristics of the topsoil arable (0–20 cm) layer, before the experiment, were: CaCO<sub>3</sub> – 0.33%, humus – 4.35%, total N- 1975 ppm, P<sub>2</sub>O<sub>5</sub>- 90.9 mg 100<sup>-1</sup>, K<sub>2</sub>O- 16.2 mg 100<sup>-1</sup>.

The study plot was previously planted with maize. The experiment was arranged in a completely randomized block design with four replicates. The net plot size was 2 × 5 m. Sowing was done in the early spring after land preparation. Lucerne was sown in monoculture and in mixtures with grasses and sainfoin in a different ratio: lucerne 50% + orchardgrass 50%, lucerne 33.3% + orchardgrass 33.3% + tall fescue 33.3%, lucerne 25% + orchardgrass 25% + tall fescue 25% + sainfoin 25%. Four different nitrogen treatments of 0, 70, 140 and 210 kg ha<sup>-1</sup> were applied, one

half, early in the spring at the beginning of vegetation and the second half, after the first cut. The nitrogen source used was ammonium nitrate (AN) with a N concentration of 34%.

The swards were cut 4 times per year. In three year period, aboveground fresh biomass was measured by cutting the sward in each plot with a beginning of lucerne flowering at approximately 5 cm above ground. Samples of 1 kg were then randomly taken from the cut material and dried in the oven at 60°C for 72 h to determine the dry matter content and the total yield. These samples were used for analyses of N content by using the Kjeldahl method.

The critical N content ( $N_c$ ) was estimated by applying mathematical model developed by *Lemaire and Gastal (1997)*, for temperate grasses and lucerne, while nitrogen nutrition index was calculated as the ratio between the real concentration of N in the plants and  $N_c$ , according to *Lemaire and Meynard (1997)*.

Statistical analyses were performed using *Statistica 8 (2007)*. Analyses of variance (ANOVA) were used to test the effects of categorical factors on tested crop properties while differences between treatments means were estimated by the LSD test. The response of NNI to other examined properties, differed among nitrogen levels, is shown graphically on the scatterplot.

## Results and Discussion

Total dry matter production was significantly higher for pure lucerne sward and fertilized treatment. In the first study year lucerne mixture with orchardgrass achieved the highest yield compared to pure lucerne crop and other lucerne mixtures. In further years, the yield of pure lucerne crop was predominant. Our results are in agreement with *Foster et al. (2014)* whose monoculture lucerne crop shows higher DMY than most grass-lucerne mixtures. On the other hand, there are studies where the lucerne mixtures have achieved higher yields than pure lucerne crop (*Malhi et al., 2002*), as well as study which proves that increasing the number of species in the mixture increases the yield (*Papadopoulos et al., 2012*). In agricultural ecosystems, grass-legume mixtures have the potential to increase productivity, herbage nutritive value and resource efficiency (*Peyraud et al., 2009*). Recent results of a great European experiment, with two grasses and two legumes at thirty-one sites, have demonstrated strong positive mixing effects (*Finn et al., 2012*). These findings are based on the complementary utilization of natural resources such as light, water, or nutrients. However, there are studies showing the presence of species in mixtures that are well adapted to the agronomic environment (soils, climate, and management), highly productive and can have major effects on productivity rather than species richness. So, the relationship between biomass productivity and species richness can vary depending on the presence or absence of

certain species (*Picasso et al., 2008*). This may have been the case in our study where set of climatic conditions and pedological characteristics have acted more favorably on the development of lucerne compared to the examined grasses.

The forage DM yield of pure lucerne and grass-legume mixtures was significantly affected by N fertilization in all three study year (Table 1). The DM yield increased with increasing N rates. The highest yields were achieved under 210 kgN ha<sup>-1</sup> while the lowest without N fertilization. *Tomić et al. (2011)* and *Bijelić et al. (2017)* also state that N fertilization significantly favors the yield of grass-legume mixtures. On the other hand, in some studies, fertilization shows no effect on grass-legume dry matter yields (*Yolcu et al., 2010*). These differences could be explained by differences in climate, soil conditions, supply of N as species characteristics.

There were no statistically significant differences between the crops in N concentration, but only in the first year of testing. In other years, the pure crop of lucerne had significantly higher N content. Concentration of N was in the range 23.9-26.9 g kg<sup>-1</sup> DM.

According to *Fairey (1991)*, herbage productivity and quality are more influenced by crop-management factors like harvesting frequency and N fertilizer supply than by the species composition of the seeded mixture. In our research fertilization significantly increased N content in forages in every study year. Also, in the study of *Sartor et al. (2014)*, pasture biomass nitrogen content is significantly affected by the addition of nitrogen fertilizers. Addition of 200 and 400 kgN ha<sup>-1</sup> increases N content by 29.4% and 35.2% respectively. Compared to this, in our experiment, lower doses of nitrogen resulted in a larger N content increase. So, the level of 210 kgN ha<sup>-1</sup> increased on average 58.8% compared to control. Species in grass-legumes mixtures respond differently to N fertilization (*Martin et al., 2017*). The lack of N response from legumes is due to their N-fixing ability. The N concentration of legumes was unaffected by increasing N-fertiliser rate, whereas in grasses and herbs it increased.

\* F statistic significant at the 0.05 probability level,

\*\* F statistic significant at the 0.01 probability level,

NS, means nonsignificant.

Type of mixtures showed no significant impact of NNI values of crops. Pure lucerne sward had higher values of NNI compared to its mixtures. Also mixtures with high contribution of legumes had greater values of NNI. This fact could be attributed to nitrogen fixation. Also, *Razec and Razec (2006)*, show in their research that values of NNI increase with the increase of legume content in the mixture. Lucerne like other examined legumes has great positive influence on the improvement of sward N supply (*Kadžiuoliene and Kadžiulis, 2007*). However, lucerne-based swards without N fertilization reach indices close to 1.0.

Nitrogen nutrition index of grass-legumes mixtures were generally significantly influenced by N fertilization across all investigation years. Values of the NNI from 0.8 to equal to 1.0 indicate that the crop is in the situation of nonlimited N supply. Treatment without N fertilization had NNI values from 0.88-0.95 which is considered optimum for supply of N. After successive nitrogen application from 70-210 kgN ha<sup>-1</sup> lucerne and their mixtures start to show luxury consumption (Figure 1).

**Figure 1. NNI vs. DM yield of grass-legume swards under four different levels of N fertilization in three years period.**

This situation showed that the swards were grown in a good soil conditions of nitrogen supply which together with the nitrogen fixation provides optimal environment for growth and development of plants. Also, applied fertilizer can contribute to accelerating the process of decomposition of organic matter, the release of nutrients and the increase of their availability for the plants. Similar results is reported by *Sartor et al. (2014)* where natural pasture of *Urochloa plantaginea* under fertilization with two N levels of 200 and 400 kg ha<sup>-1</sup>, shows consumption beyond what would be needed for its growth. On the other hand, 50 years old sward, with dominant species of *Agrostis* spp., *Holcus lanatus* and *Lolium perenne*, have not identified excessive values of the NNI for any fertilization level (*Farrugia et al., 2004*). The NNI observed for the 120 and 60 kg N ha<sup>-1</sup> treatments were between 1.0 and 0.8.

## Conclusion

In given agroecological conditions, the pure lucerne and the two-component mixture of alfalfa and orchardgrass yielded more than the other lucerne swards. Also, pure lucerne crop had significantly higher N content in relation to its mixtures.

N fertilization significantly increased DM yield of pure lucerne and grass-legume mixtures as well as the content of N in plants.

In grasslands, NNI has proved to be a useful diagnostic tool of the N status. Pure lucerne sward had higher values of NNI compared to their mixtures. Also mixtures with high contribution of legumes had greater values of NNI. NNI values were significantly influenced by N fertilization. Treatment without N fertilization had NNI values from 0.88-0.95 which indicated that the crop was in the situation of nonlimited N supply. Nitrogen treatment of 70, 140 and 210 kgN ha<sup>-1</sup> showed luxury consumption.

We can generally conclude that the sward crops were grown under conditions of good nitrogen supply. Possibly, the addition of a small quantities of N at the initial growth stages would only be justified.

## Evaluacija azotnog statusa travno-leguminoznih smeša pod uticajem četiri nivoa đubrenja

*Zorica Bijelić, Violeta Mandić, Vesna Krnjaja, Dragana Ružić-Muslić, Aleksandar Simić, Zdenka Škrbić, Dušica Ostojić-Andrić*

## Rezime

Smeša krmnih trava i mahunarki je visoko produktivna sredina različitih biljnih vrsta namenjenih za ishranu životinja. Konkurentnost vrsta u smešama je jedna od važnih osobina koje značajno utiču na upravljanje travnjacima. Cilj studije bio je da se proceni indeks ishrane azotom čiste lucerke i njenih smeša sa travama i esparzetom pod uticajem četiri različita nivoa azota u trajanju od tri godine. Eksperiment je imao randomizirani blok dizajn sa četiri ponavljanja i osam tretmana. Ispitivani tretmani bili su čist usev lucerke i smeše lucerke, ježevice, visokog vijuka i esparzete u istom odnosu i četiri doze azotnog đubrenja (0, 70, 140, 210 kg ha<sup>-1</sup>). Čista lucerka je postigla veći prinos za 12,8% u odnosu na njene smeše. Proizvodnja krme bila je najveća sa 210 kg ha<sup>-1</sup>, što je za 14,6% više od tretmana bez azota. Uzimanje azota od strane biljke koja je đubrena N je bila

značajno viša od biljaka koje nisu bile đubrene. U sve tri eksperimentalne godine kontrola je imala zadovoljavajuću vrednost indeksa ishrane azotom, dok su ostali N tretmani pokazali preteranu potrošnju. Rezerve N u zemljištu i fiksacija azota u tretmanu gde N nije primenjen, bili su dovoljni da osiguraju dovoljnu proizvodnju biomase.

**Ključne reči:** produkcija biomase, travno-leguminozne smeše, potrošnja azota
